Sekretariat betr.SS26 Beginn 01.04.26 Vorlesungen Mo 20.04 bis 25.07.2026

Das Sekretariat finden Sie in Raum 245 und 249 im zweiten Obergeschoss. Zu erreichen sind wir Mo-Fr von 8-11:30 und 12:30-16:30 Uhr.

Anna-Laura Lippek

Thomas Lais

Raum 245

Raum 249

Zeit Mo–Do: 8:00–16:30 und Fr: 8:00–16:00

Zeit Mo–Fr: 8:30–12:30

Telefon +49 761-203-5676

Telefon +49 761-203-5664

E-Mail lippek@stochastik.uni-freiburg.de

E-Mail lais@stochastik.uni-freiburg.de

Adresse

Albert-Ludwigs-Universität Freiburg

Abteilung für Mathematische Stochastik

Ernst-Zermelo-Straße 1

79104 Freiburg

Germany

Raum 245 und 249 (2. Obergeschoss)

Telefon +49 761-203-5664/5676

Fax +49 761-203-5661

E-Mail sekretariat@stochastik.uni-freiburg.de

Projekte

- Zusammen mit [Angelika Rohde](#) und [Sabine Lutz-Bonengel](#) bin ich Projektleiter in einem Projekt zur forensischen Genetik des Sonderforschungsbereichs [Small Data](#).
- Momentan bin ich Mitglied des Direktoriums des [Freiburger Zentrums für Datenanalyse und Modellbildung \(FDM\)](#).
- Momentan bin ich Mitglied des Direktoriums des [Freiburg Advanced Center of Education \(FACE\)](#).

Forschungsschwerpunkte

- Probabilistic modeling in the life sciences
- Population genetics
- Chemical reaction networks
- Markov processes

Sprechstunde:

Bitte schreiben Sie mir eine Email, wenn Sie mich kontaktieren wollen.

Ernst-Zermelo-Straße 1 Zimmer 233 D - 79104 Freiburg

Tel: +49-761-203-5667 Fax: +49-761-203-5661

E-Mail: peter.pfaffelhuber@stochastik.uni-freiburg.de

Adresse:

Python for Data Analysis

Peter Pfaffelhuber Tue, 12–14 h, SR 127, Ernst-Zermelo-Str. 1

Content:

This course is designed for students without prior knowledge in programming, but students who have already taken a first programming course might benefit as well. We will start with basic syntax and the standard library of python, including data types, functions, loops, regular expressions, and interacting with the operating system. For data analysis we learn dataframes using packages such as pandas (and relatives), see how we can interact with freely available APIs, make plots using matplotlib, and use numpy and scipy for standard procedures including numerical computations. Within this course, you will pick a programming task of your interest, and implement your ideas based on your gained knowledge. Prerequisites: none Remarks: Cannot be credited together with Programming Exercises in Stochastics in Python. Usable in the following modules: Elective (MScData24) Computer Exercise (2HfB21, MEH21, MEB21)

Mathematik II für Studierende der Ingenieurwissenschaften

Peter Pfaffelhuber, Sebastian Stroppel

Vorlesung: Mo, Mi, 16-18 Uhr, HS Rundbau, Albertstr. 21

Numerics II

Patrick Dondl,

Assistant: Jonathan Brugger

in German

Lecture: Wed, 14–16 h, HS Weismann-Haus, Albertstr. 21a

Tutorial: 2 hours fortnightly, various dates

Sit-in exam: date to be announced

Content:

Numerics is a discipline of mathematics that deals with the practical solution of mathematical problems. As a rule, problems are not precisely solved but approximated, for which a sensible compromise of accuracy and computing effort has to be found. In the second part of the two -semester course, questions of the analysis such as the approximation of functions by polynomials, the approximately solution of non -linear equations and the practical calculation of integrals are treated. Attendance at the accompanying computer exercise sessions is recommended. These take place fortnightly, alternating with the tutorial for the lecture. Prerequisites: necessary: Linear Algebra I and Analysis I useful: Linear Algebra II, Analysis II

Computer exercises in Numerics

Patrick Dondl in German

Programming exercise: 2 hours fortnightly,

various dates Content: In the practical exercises accompanying the Numerics II lecture, the algorithms developed and analysed in the lecture are implemented in practice and tested experimentally. The implementation is carried out in the programming languages Matlab, C++ and Python. Elementary programming skills are assumed.

Prerequisites: See the lecture Numerics II.

In addition elementary programming knowledge. Usable in the following modules: Computer Exercise (2HfB21, MEH21, MEB21) Elective (Option Area) (2HfB21) Numerics (BSc21) Supplementary Module in Mathematics (MEd18)

Introduction to Programming for Science Students

Stefan Kater in German

Lecture: Mon, 16–18 h, HS Weismann-Haus, Albertstr. 21a

Tutorial: 2 hours, various dates

Content:

Die Veranstaltung bietet eine Einführung in die Programmierung mit theoretischen und praktischen Einheiten.

Schwerpunkte der Veranstaltung sind • logische Grundlagen der Programmierung • elementares Programmieren in C • Felder, Zeiger, abgeleitete Datentypen, (Datei-)Ein- und -ausgabe • Algorithmik • Programmieren und Visualisieren in MATLAB/GNU Octave • paralleles und objektorientiertes Programmieren. Die praktischen Inhalte werden in der Programmiersprache C++ sowie in MATLAB/GNU Octave erarbeitet. Die erworbenen Kenntnisse werden anhand von Übungen erprobt und vertieft. " Literature: • S. Bartels, C. Palus, L. Striet: Einführung in die Programmierung für Studierende der Naturwissenschaften, Vorlesungsskript. • G. K\"uveler, D.

Mathematical Physics II

Chiara Saffirio in English

Lecture: Mon, 14–16 h, SR 404, Ernst-Zermelo-Str. 1

Tutorial: 2 hours, date to be determined and announced in class Content: - Introduction: short review on classical, basic notions of quantum mechanics, semiclassical analysis; - Semiclassical pseudo-differential calculus: motivation, oscillatory integrals and symbol classes, Schwartz kernels of pseudo-differential operators and symbolic calculus; - Applications to static and dynamical problems in physics. Prerequisites: necessary: Analysis I and II, Measure and Integration Theory, Probability Theory I and II. useful: Functional Analysis, Introduction to Mathematical Physics.
